Errata

On Coppock, Green, and Porter (2026), *Quarterly Journal of Political Science*

The maintained replication code behind these errata is at https://github.com/active-maintenance-aec/coppock_green_porter_2026 and is archived at Zenodo at https://doi.org/10.5281/zenodo.24168353, a DOI that always resolves to the latest version.

This note lists corrections to "Americans can imagine changing partisan affiliation: evidence from hypothetical scenarios," published in the *Quarterly Journal of Political Science* 21(1): 26-48, doi 10.1108/QJPS-02-2025-0026. Entry 5 qualifies a reported null result, and no entry changes a conclusion of the article. Bold marks each change. Passages separated by a slash are separate sentences or labels. The analysis is in the repository `coppock_green_porter_2026`.

1. The evaluation index

Published, pp. 38-39:

> A partisan evaluation index that averages together the following 12 outcomes / FT Mike Pence (reversed), vote preference

Corrected:

> A partisan evaluation index that averages together the following **14** outcomes / FT Mike Pence (reversed), **FT Democratic Party, FT Republican Party (reversed),** vote preference

The cleaned data's index equals the mean of these 14 items exactly in both studies, and p. 41 says 14. The pre-analysis plan lists 12, so this is also a departure from the plan. With the listed 12 items, Study 2's Pro-Democratic estimate is 0.010 (SE 0.005), against 0.010 with 14.

2. Study 1's sample

Published, p. 33:

> In Study 1, we recruited 988 respondents

Corrected:

> In Study 1, we recruited **995** respondents

Figure 2(a) enrolls 334, 334, and 327, and the cleaned data and the rerun from raw exports both hold 995. The 988 is the pre-analysis plan's count, made by an earlier cleaning of a 2023-08-23 export. That export held only completed interviews, and the earlier cleaning dropped its first two data rows as if they were Qualtrics header lines, though they were two completed interviews that passed the attention check. The later exports also hold five partial interviews closed on 2023-08-24, and Study 2's cleaning keeps partial interviews too. Figure 7's Study 1 column was estimated on the 988-row file: 12 of its 48 labels move in the third decimal, and no sign or significance changes.

3. A percentage point or less

Published, p. 42:

> with estimates of a percentage point or less

Corrected:

> with estimates of **1.1 percentage points** or less

The largest of Study 1's four index estimates is 0.011 in Figure 7's own label. The sentence's meaning does not change.

4. Two of the Gallup swings

Published, p. 44:

> and 2003–2009 (10.7 points) / 1977–1985 (−18.7 points), 1965–1968 (−10.5 points) and 1993–2002 (−9.4 points)

Corrected:

> and 2003–2009 (**10.8** points) / 1977–1985 (−18.7 points), 1965–1968 (−10.5 points) and **1997–2003 (-11.0 points)**

The 10.7 subtracts two rounded values, and the difference itself is 10.77. The script's own search within 40 quarters returns the 1997–2003 fall, from 1997q3 to 2003q4, and it is larger than the second. The printed 1993–2002 span is a true difference between its two quarters and is not among the largest. The comparison the sentence supports is unchanged.

5. Two Study 2 index effects

Published, p. 43, with the test on p. 39:

> Figure 7 shows that in Study 2, the effects on these post-treatment outcomes were also null

Corrected:

> Figure 7 shows that in Study 2, the effects on these post-treatment outcomes were also null**, save two pro-Democratic effects of about 0.01 on the 0-1 evaluation and identification indexes (one-sided p-values 0.019 and 0.011) that do not survive correction for multiple comparisons**

Page 39 tests pro-Democratic effects one-sided at 0.025 in the pro-Democratic direction. On party ID that direction is down (1 = Strong Democrat), and on the two indexes it is up. The deposit's script took the lower tail for every pro-Democratic estimate, so on the indexes it tested the wrong direction and reported 0.981 and 0.989. The estimates are 0.010 (SE 0.005) on the evaluation index and 0.010 (SE 0.004) on the identification index, and the Benjamini-Hochberg p-value across the 96 tests is 0.435 for both. Party ID stays null, and Figure 7, which prints no p-values, is unchanged. Separately, the Study 1 script matches a label it has already renamed, so all 24 of its Pro-Democratic one-sided p-values are missing. With that repaired, the same page's "one significant result" among subgroups still holds, at 0.009.

6. The ANES year

Published, p. 34:

> showed them the distribution of party ID as measured in the 2016 ANES

Corrected:

> showed them the distribution of party ID as measured in the **2022** ANES

Both fielded instruments say "In a 2022 survey", and the appendix's Section C.1 reproduces that text and says "in 2022".

7. When the scenarios were fielded

Published, p. 27:

> In the spring of 2024, we asked participants

Corrected:

> In **August 2023 and February 2024**, we asked participants

The raw exports' start dates put Study 1 in August 2023, apart from four interviews, and all of Study 2 in February 2024.

8. Labels in Figure 2

Published, p. 37, Figure 2:

> (a): 5 Pro-Status Quo Hypotheticals / 334 Independents enrolled / 327 Republicans enrolled. (b): 5 Pro-Democratic Hypotheticals / 5 Status Quo Hypotheticals / 5 Pro-Republican Hypotheticals / 1,016 Independents enrolled / 1,017 Republicans targeted and enrolled

Corrected:

> (a): 5 **Status Quo** Hypotheticals / **327** Independents enrolled / **334** Republicans enrolled. (b): **6** Pro-Democratic Hypotheticals / **6** Status Quo Hypotheticals / **6** Pro-Republican Hypotheticals / **1,017** Independents enrolled / **1,016** Republicans targeted and enrolled

Page 36 says Study 2 added a sixth scenario, and its data hold six. The cleaning scripts give the Republican recruitment batch the independents' label and the reverse: in both studies, more than nine in ten respondents in the batch the figure counts as independents place themselves at 5 to 7 before treatment. Only the labels change. The estimates use the batch as a covariate, where its name does not matter.

9. Labels in Table B.3

Published, app. Table B.3, three rows:

> Org 2 vs Org 2

Corrected:

> Org 2 vs **Org 1**

The rows report the `Z:orgorg2` interaction, and line 222 of the field script mistypes the label. Only the label changes.

10. A column missing from Table A.2

Published, app. Table A.2:

> Charisma / Social Identity / Performance / Issues / Generic / Placebo

Corrected:

> Charisma / Social Identity / Performance / Issues / Generic / **Negative Partisanship (148, 270, 428, 789, 1500, 429, 894)** / Placebo

The table's script sums five video indicators, so the cells of each row do not reach dose times N. The twelfth ad, Negative Partisanship, is the sixth video in these studies. The added cells run down the table's nonzero doses. They are dose times N less the printed five, and the cleaned data's `notaparty` indicator sums to each of them. For Studies 3 and 5 they also equal the count of that video in `video_all`, which does not name it in Study 4. The printed cells stand.

11. The naive intervals in Figure A.4

Published, app. Figure A.4:

> Naive estimate (95% CI), e.g. Study 4: 6 Ads, −0.21 to 0.24

Corrected:

> Naive estimate (95% CI), e.g. Study 4: 6 Ads, **−0.16 to 0.19**

The bootstrap set each naive estimate's standard error to the spread of the lower bound's replicates rather than its own. From the same draws, the corrected intervals are 0.77 to 1.05 times as wide as the printed ones, and every interval still spans zero. The bounds and their intervals do not change.

12. Wording, main text

Published, pp. 34, 35, 38, 39, 44, and 45:

> the fact that respondents snap back to their earlier partisan identity after the hypotheticals suggest / call up the National Guuard / Marjorie Taylor Green (twice) / For Republicans in this study, the Guns hypothetical / Goren and Chap, 2017 / ruminating on hypothetical scenarios, even those that respondents find plausible, are insufficient

Corrected:

the fact that respondents snap back to their earlier partisan identity after the hypotheticals **suggests** / call up the National **Guard** / Marjorie Taylor **Greene** (twice) / For **the pro-Republican hypotheticals** in this study, the Guns hypothetical / Goren and **Chapp**, 2017 / ruminating on hypothetical scenarios, even those that respondents find plausible, **is** insufficient

The fielded instruments read Guard. Crossref gives the family name Chapp.

13. Wording, references

Published, pp. 46-48:

> "Short-term forces and partisan-ship" / "Where to place sensi-tive questions? / a field experiment with ffox nnews viewers / Goren, P. and Chap, C. / Petty, R.E., Cacioppo, J.T., Petty, R.E. and Cacioppo, J.T.

Corrected:

> "Short-term forces and **partisanship**" / "Where to place **sensitive** questions? / a field experiment with **Fox News** viewers / Goren, P. and **Chapp**, C. / Petty, R.E.** and** Cacioppo, J.T.

14. Wording, appendix

Published, app. Sections A to C:

> treatment views encountered / We used a placebo-controlled designs / the response rates by save and condition / a few more demographic variable / Outcomes were assess via telephone survey / Marjorie Taylor-Green / The results are shows in Figure C.7 / The entries in TableC.5 / the basic patten we obtained

Corrected:

> treatment **videos** encountered / We used **placebo-controlled designs** / the response rates by **wave** and condition / a few more demographic **variables** / Outcomes were **assessed** via telephone survey / Marjorie Taylor **Greene** / The results are **shown** in Figure C.7 / The entries in **Table C.5** / the basic **pattern** we obtained
